STUDENT PROJECT / FIRST SEMESTER 2026

Parfumi Store

A React application with Redux state management

STUDENT	MODULE	INSTITUTION
Abdeldjabbar	WAMD TD-TP 2	ENSTA Higher National School of Advanced Technologies

Project overview

Parfumi Store is a small perfume e-commerce frontend built with React. It presents a perfume catalogue, allows users to search by product name, and provides a shopping cart managed with Redux Toolkit. The original Parfumi storefront layout and visual styling are retained.

Implemented features

PRODUCT CATALOGUE Browse the local starter collection and search perfumes by name.	REDUX SHOPPING CART Add items, change quantities, remove products, and view totals.
LOCAL PRODUCT MANAGEMENT Demo admin can add, edit, and delete products in this browser.	BROWSER PERSISTENCE Cart, catalogue changes, and demo session use localStorage.

Frontend-only scope

No backend or database is required. The project runs in the browser. Account access and product management are demonstration-only; passwords are not sent to a server. Checkout only displays a notice and does not process payments or create orders.

Technologies

React	**JavaScript / JSX**	**Redux Toolkit**	**React-Redux**	**Vite + CSS**

APPLICATION STRUCTURE

Components and state

How the React interface is organized and how Redux manages the shared cart.

Main React components

COMPONENT	RESPONSIBILITY
App.jsx	Composes the storefront layout and connects the main sections.
Navbar.jsx	Renders the brand header and product-name search.
AccountSidebar.jsx	Displays the local account area and demo account actions.
Products.jsx / ProductCard.jsx	Shows the catalogue, filters by search text, and provides product actions.
Cart.jsx	Reads the Redux cart, dispatches cart actions, and calculates totals.
ProductForm.jsx	Provides the local add-product and edit-product form.
AuthModal.jsx / AuthContext.jsx	Implements the local demonstration sign-in and session state.

Redux state

STATE	ACTIONS	PERSISTENCE
`state.cart.items` - the items and quantities currently in the shopping cart.	`addToCart(product)` `decreaseQuantity(id)` `removeFromCart(id)`	Saved in browser localStorage using the key `parfumi_cart`.

Run locally

```
npm install
npm run dev
```

Requirements: Node.js 20.19+ or 22.12+, and npm. Open the Vite local URL shown in the terminal (normally `http://localhost:5173`). Use `npm run build` to create a production build.

Screenshots for submission

Save the final application screenshots in the `Screenshots/` folder at the project root, next to `src/`, `public/`, and `README.md`. Recommended captures: 01-storefront.png, 02-shopping-cart.png, 03-product-search.png, and optionally 04-local-admin.png. Capture them after running this frontend-only version.

Important note

The local admin role is only a UI demonstration and is not secure access control. Catalogue changes and the cart remain in the current browser only. No real accounts, server-side data, orders, or payments are created by this version.
